

NARENDRA JARJAPU

Software Engineer in Test | QA Automation Engineer | QA Lead | Banking & Core Systems Quality Engineering

Florence, KY 41042 | 321.525.3973 | jnarendra1410@gmail.com | [LinkedIn](#) | [Portfolio](#)

PROFESSIONAL SUMMARY

Software Engineer in Test with 8+ years of experience in test automation, data validation, and quality engineering across banking, healthcare, networking, and SaaS. At Fifth Third Bank, lead test engineering for Time Deposits (Certificate of Deposit) core conversion, the FIS Modern Banking Platform, and mainframe batch validation. Skilled in Python, React.js, Pytest, SQL, BDD/Gherkin, Tricentis qTest, CI/CD, and AWS, with a record of building data-driven test frameworks that reconcile large financial datasets and catch critical defects before go-live, including balancing automation that reduced 1-2 hours of manual entry per application to under 20 seconds and was adopted as the company-wide balancing summary template. Partners with Line of Business (LOB) stakeholders, business analysts, product owners, and development teams across the full SDLC/STLC, from requirements analysis and test strategy through multi-environment testing (DEV, QE, SIT/Stage, UAT), release readiness, and production sign-off, and leads QA efforts that inform go/no-go decisions. Uses AI-assisted engineering with GitHub Copilot to speed up test design, automation, and analysis while keeping every result checked against source code and real data.

CORE COMPETENCIES

SDLC & STLC | Test Strategy & Test Planning | Test Case Management & Requirements Traceability (Tricentis qTest) | QA Leadership | Line of Business (LOB) Partnership | Requirements Analysis | Multi-Environment Testing (DEV, QE, SIT/Stage, UAT) | User Acceptance Testing (UAT) | Release Readiness & Go/No-Go | Test Automation Framework Design | Automated Test Coverage | Risk-Based Testing Strategy | BDD/TDD (Gherkin, Cucumber) | End-to-End & Integration Testing | Mainframe & COBOL Batch Validation | Data Conversion & Reconciliation | Banking Calculations (Interest, Penalty) | ETL & Data Quality Testing | UI Automation (Selenium WebDriver, Page Object Model) | React.js UI Testing | SaaS Application Testing | API Testing | AI-Assisted Development (GitHub Copilot) | CI/CD | Agile/Scrum | Defect Reporting, Coverage Gap Analysis & Root Cause Analysis | Stakeholder Communication

PROFESSIONAL EXPERIENCE

Software Engineer in Test | Fifth Third Bank

11/2023 – Present

Applications & Tools: Time Deposits (CD) Mainframe, FIS Modern Banking Platform (MBP) Back Office, Selenium WebDriver, Retirement Reporting System (RRS), Safebox Accounting, RAFT, Tricentis qTest (Manager, Insights), Python, Pytest, SQL, COBOL, FTP, Git, GitHub Copilot, CICS, TSO regions

- **Core Conversion Testing:** Lead QA for the Time Deposits (CD) data conversion, validating 140K+ source accounts and 90K+ converted certificates; designed and automated 45+ Python/Pytest test cases covering account, customer, branch, hold, and product-type mapping rules against COBOL conversion logic.
- **SDLC & Test Strategy:** Owned the test strategy and test plans across the full SDLC/STLC, covering requirements analysis, test design, test data preparation, execution, defect triage, regression, multiple mock conversions, and production cutover validation.
- **Multi-Environment Testing:** Planned and executed testing across DEV, QE, SIT/Stage, and UAT environments for mainframe (CICS/TSO regions) and FIS Modern Banking Platform releases, validating environment-specific configuration, test data, and batch results at each promotion gate before production cutover.
- **Financial Reconciliation:** Built end-to-end balance and accrued-interest reconciliation suites across source, cross-reference, and post-conversion files, reconciling \$295M+ with \$0.00 variance and identifying a \$140M product-mapping defect before go-live.
- **Balancing Automation & Leadership Reporting:** Built Python balancing automation for Time Deposits, Retirement Reporting System (RRS), and Safebox Accounting that ingests 24+ bank-level reports and generates leadership-ready balancing packets and executive summary workbooks in under 20 seconds, replacing 1-2 hours of manual bank-by-bank data entry per application (3-6 hours per conversion cycle) across 4 cycles (Mock 2, Mock 3, Pre-CD1, and CD1 Live). The balancing summary was adopted as the company-wide template for conversion balancing and leadership sign-off.
- **FIS Modern Banking Platform:** Tested CD accounts on the FIS Modern Banking Platform, a cloud-based SaaS core banking solution, including account inquiry, maintenance, maturity and renewal operations, and built end-to-end test cases covering integrations with downstream applications.

- **UI Automation:** Developed Selenium WebDriver automation scripts for the FIS Modern Banking Platform Back Office using the Page Object Model (POM), automating CD account inquiry, setup, and maintenance workflows for regression testing.
- **Banking Calculations:** Automated Early Withdrawal Penalty (EWP) and Daily Accrual Interest tests (simple and compound, 360/365/366-day basis), validating 50K+ certificates against mainframe business rules.
- **BDD & Test Design:** Designed test scenarios in Gherkin (Given/When/Then) format from conversion business rules; tracked automated test coverage against conversion rules, identified testing gaps, and reported defects with supporting evidence and results to development, business, and leadership.
- **Tricentis qTest Test Management:** Managed the end-to-end test lifecycle in Tricentis qTest Manager, organizing requirements, test cases, and test cycles by release and conversion milestone (Mock 2, Mock 3, Pre-CD1, CD1 Live); linked Jira user stories and defects to qTest requirements to maintain a requirements traceability matrix (RTM) and audit-ready evidence of coverage for every conversion rule.
- **qTest Execution & Reporting:** Built test cycles and test suites in qTest for DEV, QE, SIT/Stage, and UAT, assigned test runs to QA and LOB testers during UAT, and captured step-level results with screenshots and file evidence; imported Pytest automation results (JUnit XML) into qTest so manual and automated execution were tracked together, and used qTest Insights dashboards for execution progress, pass/fail rates, and defect trends in daily status and go/no-go meetings.
- **Test Asset Reuse & Standards:** Standardized qTest test case templates, naming conventions, and folder structure for Time Deposits, RRS, and Safebox Accounting; built reusable regression suites and shared test steps that were re-executed across each mock conversion, reducing test preparation effort and keeping results consistent between cycles.
- **Line of Business Partnership:** Partnered with Deposits and Time Deposits Line of Business (LOB) stakeholders, business analysts, product owners, and operations teams to translate business rules into testable acceptance criteria, support User Acceptance Testing (UAT), and obtain business sign-off on balancing results.
- **QA Leadership:** Led defect triage and test status meetings with development, LOB, and leadership; presented quality metrics, risks, and go/no-go recommendations for mock conversions and production cutover, and mentored team members on Python/Pytest automation and test design.
- **Mainframe Automation:** Developed a Python FTP mainframe utility to automatically download daily certificate and customer extracts (EBCDIC, packed decimal), removing manual file transfers and enabling daily regression runs.
- **CICS Regression:** Automated CICS mainframe SafeBox Rental screen regression testing and worked with TSO regions to support test execution and validation.
- **RAFT Validation:** Built a RAFT-style Certificate Inquiry screen tool that displays converted account fields in mainframe format for fast business and development validation.
- **Retirement Testing:** Automated Retirement (IRA) testing for FMV, RMD, and IRS/1099 regression across 185K+ accounts.
- **AI-Assisted Engineering:** Used GitHub Copilot (chat and agent mode) to speed up test case design, Python automation, COBOL logic analysis, and debugging; reviewed all AI output against source code and real data to keep results accurate and audit-ready.

Senior Data QA Engineer | StyleSeat, Inc.

06/2022 – 10/2023

- Led backend and data testing for the SaaS booking and scheduling platform across web, iOS, and Android; used a risk-based testing strategy to prioritize P0/P1/P2 test cases in TestRail and automated validation with Python, Pytest, Cypress, SQL, and DBT.
- Partnered with product managers, engineers, and business stakeholders in Agile sprints to refine user stories and acceptance criteria, define release test scope, and provide quality sign-off for production releases.
- Validated every release across DEV, QE, Staging, and UAT environments, running smoke and regression suites at each promotion gate before production deployment.
- Reduced search reindexing time from 14 to 4 hours, improving user experience and booking revenue.
- Built an end-to-end ETL data ingestion pipeline from Amazon Kinesis Firehose using Python, Airflow, Boto3, and Docker; automated A/B testing for the Search API and Elasticsearch.
- Improved CI/CD reliability in CircleCI with Slack failure alerts and faster log-based debugging.
- Integrated automated test execution into Azure DevOps CI/CD pipelines, publishing results and surfacing failures for faster feedback.
- Developed Playwright end-to-end tests for React.js booking workflows, extending automated regression coverage across the web platform.

- Tested React.js front-end components and UI flows (search, booking calendar, checkout, and account settings) with Cypress and Playwright, validating API integration, state handling, and cross-browser behavior for the SaaS platform.

Python Automation Test Engineer | Cisco Systems, Inc.

02/2021 – 05/2022

- Increased testing efficiency by implementing the QALI framework for REST API and GUI automation across blade and rack servers using Python and Selenium WebDriver.
- Built a Page Object Model (POM) framework with reusable page classes, data-driven tests, explicit waits, and cross-browser runs, reducing flaky tests and maintenance effort.
- Created test plans, automated server health checks, and managed OS upgrades on network switches.
- Collaborated with development, hardware, and quality teams across the SDLC to review requirements, define test coverage, and report results that supported release readiness decisions.
- Executed test cycles across DEV, QE, and staging lab environments, validating firmware, OS, and configuration changes before release to customers.
- Developed and maintained Python-based test procedures and automation scripts to validate server functionality, system configuration, and repeatable test workflows.
- Executed TPM clear validation across multiple server platforms, verifying expected behavior and documenting results to support reliable system provisioning.
- Supported sustaining updates to test environments and maintained test procedures and infrastructure documentation in coordination with cross-functional engineering and quality teams.

Python Automation Engineer | Blue Cross Blue Shield

09/2020 – 01/2021

- Cut data transfer time by ~50% by automating Amazon S3 transfers with AWS DataSync and Boto3.
- Reduced AWS costs by ~20% by monitoring usage and removing underutilized resources; built TDD/BDD frameworks with Pytest and automated CloudTrail log reporting.
- Worked with business and data stakeholders to gather requirements and validate data transfer and reporting outputs against business needs.
- Validated data pipelines and AWS automation across DEV, QE, and UAT environments before production rollout.

Software Engineer | Cisco Systems, Inc.

12/2018 – 08/2020

- Deployed containerized applications to AWS EKS using Docker and Kubernetes, improving scalability and availability.
- Promoted and validated containerized deployments across DEV, Stage, and Production EKS environments.
- Developed Python API scripts for enterprise SaaS client deployments, including General Motors, AT&T, and T-Mobile.
- Introduced Python/Selenium WebDriver test automation with Page Object Model design and automated job workflows using Apache Airflow.
- Built and tested React.js front-end components for internal deployment dashboards, integrating with Python REST APIs and validating UI behavior through automated tests.

Research Assistant | Florida Institute of Technology

01/2017 – 06/2018

- Built a Python Django application with REST APIs and automated Excel/CSV data processing.

TECHNICAL SKILLS

Languages: Python, SQL, COBOL, JavaScript, TypeScript, React.js, Go, C

Operating Systems: Unix, Linux

Testing & Frameworks: Pytest, Playwright, Selenium WebDriver, Page Object Model (POM), Cypress, Cucumber, Gherkin, BDD, TDD, Postman, REST API Testing, Cross-Browser Testing, Data-Driven Testing

Testing Methodologies: SDLC, STLC, Agile/Scrum, Shift-Left Testing, Risk-Based Testing, Multi-Environment Testing (DEV, QE, SIT/Stage, UAT), Functional, Integration, System, Regression, Smoke, End-to-End, UAT, Data Validation

Test Management: Tricentis qTest (Manager, Insights, Jira Integration), TestRail, Jira

AI & Productivity: GitHub Copilot (Chat, Agent Mode), Prompt Engineering, AI-Assisted Test Design & Code Review

Banking & Mainframe: FIS Modern Banking Platform, IBM Mainframe, COBOL Batch, RAFT, FTP, EBCDIC/Packed Decimal, CICS, TSO regions

CI/CD & DevOps: Azure DevOps, Jenkins, CircleCI, Git, GitHub, Bitbucket, Docker, Kubernetes

Cloud & Data: AWS (EC2, EKS, Kinesis, CloudWatch), AWS Glue, S3, Lambda, Redshift, Apache Airflow, DBT, SQL Server, Oracle, MySQL, MongoDB, Amazon Deequ
